Infection Control Procedure

Prior to the commencement of work, all incoming materials that have been in contact with patients are disinfected by atomising spray of a specialised dental disinfectant.

All outgoing materials are visibly clean, having been washed in hot water and detergent. Outgoing materials made from wax are cleaned with detergent and cold water.

Finishing products that have been in contact with used prosthetics are disposed of and replaced, at which time all trays and containers used for storing them are cleaned and disinfected.
